

## Long term leg ulcer

Dr. Matthew Dryden

### Introduction

This 91 year old lady lived independently with her nephew. She had developed leg ulcers over a period longer than 6 months. The ulcers had become progressively worse over several weeks. The level of exudate and pain had become so severe that she had to be admitted to hospital to care for the ulcer.

Her admission to hospital was solely due to the ulcers. Treatment was changed to a simple routine involving application of SurgihoneyRO™.

### Day 0

The wound measured 15cm x 5cm x 0.3cm and was infected with 50% of the wound colonised green.

### Day 11 -14

By day 11 following routine SurgihoneyRO™ applications the ulcers were much improved and were epithelialising well. There was no odour, no slough and the pain was much reduced. The infection was eliminated. The wound reduced in size to 10cm x 5cm x 0.2cm. The lady was discharged home on day 14.
